

CCDC Inject

INJECT NAME	Document Firewall Security Policy
INJECT ID	BCOM02T

INJECT DESCRIPTION:

Create a document that describes the current firewall security policy. The document will be used as part of the organization's technical documentation library. Perhaps in tabular format, describe the purpose for each entry in the security policy, and any key attributes might be associated with that entry, such as logging enable or disabled, or an IPS feature. The important element is to fully describe what this particular entry is to accomplish in the overall policy. For example: "allows originating packets from the external segment to the web server at host address x.x.x.x using tcp destined for port 80".

INJECT DELIVERABLE

Create a clear concise document that can be used by other engineers to understand the current firewall policy, to the degree that it could be recreated on another firewall.

Include, as an appendix, a screen shot of the actual security policy as configured in the firewall.
