

CCDC Inject

INJECT NAME	Use a Crypto Solution to Authorize Devices
INJECT ID	CRYP06A

INJECT DESCRIPTION:

Design and prototype a solution for authorizing devices (for example, a PC) for SSH access to a server. This would require that not only does the user need username and password credentials, but would also need to use a particular device. The device would need to be authorized.

INJECT DELIVERABLE

Create a business memo that describes your solution and then the details of its implementation for one device and a server, as a prototype of the solution. Include screen shots that show a functional prototype implementation. Be clear on all the steps needed to implement the prototype.
