

# CCDC Inject

<b>INJECT NAME</b>	Securing Home Directories on Linux
<b>INJECT ID</b>	LINX01T

## **INJECT DESCRIPTION:**

For each Linux server, locate the home directories for the user and verify that these directories are only accessible by the owners.

If you find a directory that is not secured properly, then use a Linux command to set the protections correctly.

## **INJECT DELIVERABLE**

Respond with a business memo that:

1. List the Linux command you would use to set the permissions mask on a home directory so that only the owner had access.
2. Explain how you discovered where the home directories are stored on each machine.
3. Enumerate any directories/users that were not set for owner-only access.
4. Show a screen shot of a listing from 1 server that displays the directory permissions of home directories.
