

Team 1

NETW15A

To the Information Network team:

I am writing to report on the security of the in-band network management of our devices. The objective of this was to review and verify that the only devices able to access these tools are authorized.

In order to achieve this objective, we have disabled the use of SSH on our networks, as it was not assessed that it was necessary for our day-to-day operations.

Attached is a screenshot of the disabling of the SSH management for the superuser profiles.

If you have any questions or need further information, please do not hesitate to reach out.

Best regards,

Group 1
