

# CCDC Inject

|                    |                                 |
|--------------------|---------------------------------|
| <b>INJECT NAME</b> | Finding Rogue Network Processes |
| <b>INJECT ID</b>   | SOCS02T                         |

## **INJECT DESCRIPTION:**

Evaluate each of the servers in the organization's environment with the netstat tool to find the processes that are listening on network connections. Are all these processes valid and listening expected ports using expected protocols (i.e. TCP/UDP)?

## **INJECT DELIVERABLE**

Respond with a business memo that summarizes your results. There should be a section for each server. Each server section should have a table that identifies the well-known network ports that are in use. Clearly identify any processes that are suspicious and what the next steps are to validate or mitigate it.
