CCDC Inject

INJECT NAME	Protect Linux Servers from Unnecessary Packets
INJECT ID	LINX04A

INJECT DESCRIPTION:
On each Linux Server implement host firewalls with corresponding policies that effect the control of inbound packets to only permit those that are expected.

INJECT DELIVERABLE
Respond with a business memo that describes how you accomplished this. Describe in technical detail what packets profiles are permitted (for example: only TCP packets destined for service port 22 coming from a particular network profile).

With screen shots, show the server configuration that was used to accomplish this and log entries showing packets not fitting the profile being denied.
